

Data visualization that works everywhere

Fincentric's charting capabilities represent the best in modern web practices, producing charts that look great across devices and deliver through a variety of media, including web, PDF, alerts, video and more.

Features

Responsive layout, great for desktop, tablet and phone

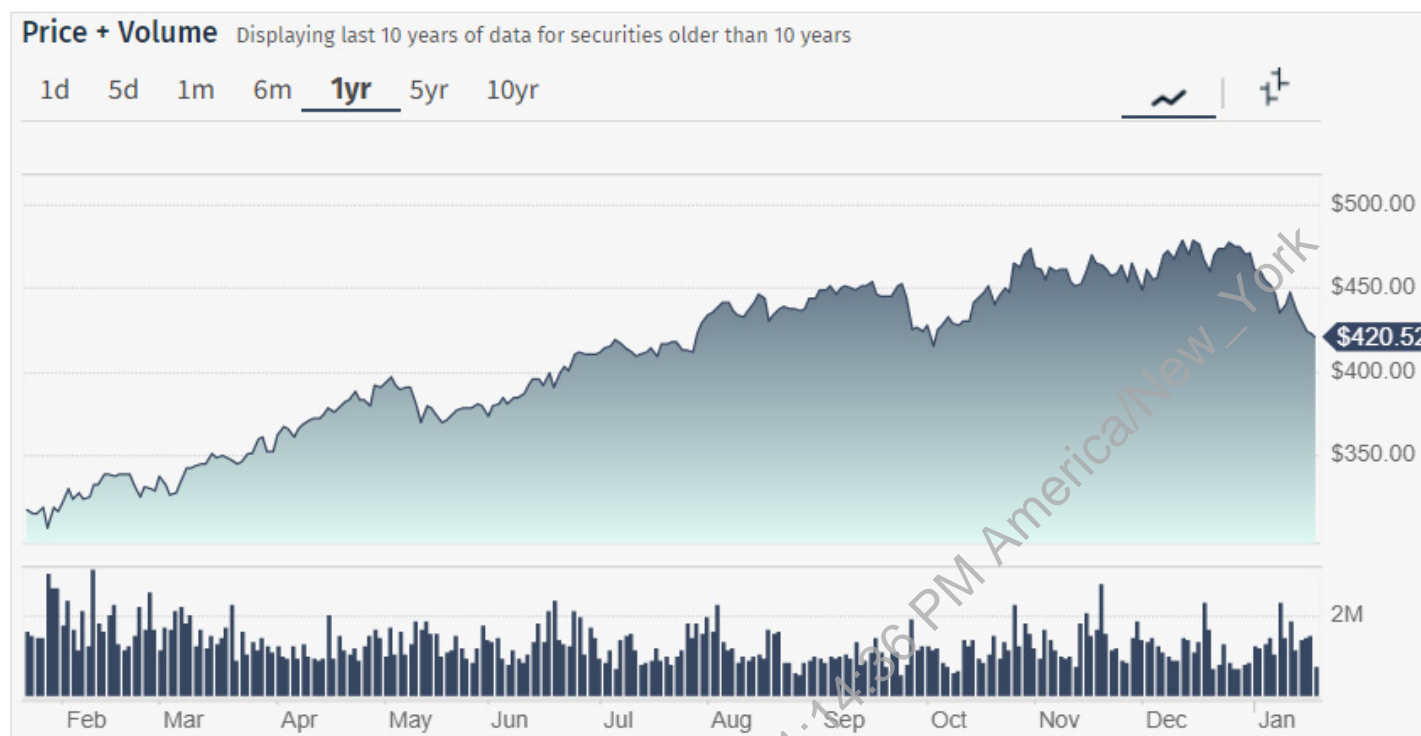

Fluid panning and zooming of all chart data

Full suite of upper and lower indicators

Extensive drawing and annotation tools, including Fibonacci analysis

Chart templates

Accessibility features

Advanced Charting Library (ACL)

The Advanced Charting Library is the toolkit our developers use to build timeseries financial charts that show how one or more securities has performed over time. Using the library, our engineers build highly stylized chart experiences that are custom-built to client specifications.

The ACL can be used to build charts from the simplified to the most advanced workspace tools for technical analysis.

Image charts

Simple but powerful, image-based charts work great on any platform or browser. These charts are incredibly versatile and are used in a wide range of scenarios. Combining data APIs and standard templates that allow designers to interact with real-life examples and developers to build to spec every time. These are ideal for non-interactive data visualizations that appear in web, PDF reports or email alerts.
