APIs in our library

Seamless data

Fincentric provides robust APIs for all types of financial data, including structured and unstructured.

Our API integration follows the Restful JSON model and supports many content scenarios. API request parameters are sent as HTTP GET or POST requests, and the response can be returned in various formats, including XML, JSON, JSONP and YAML.

We supplement our APIs with documentation detailing input parameters and expected outputs, as well as API end points and data type schemas.

Entitlements

Entitlements can be applied to APIs so users can be targeted with specific content on a request-by-request basis. We establish an agreed-upon mechanism at the outset for authenticating and entitling content.
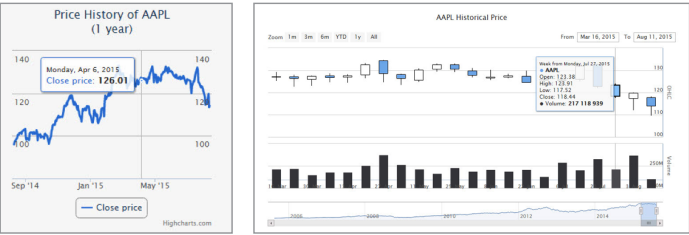

Data aggregation

Fincentric data APIs allow you to incorporate data into modules or pages developed and hosted by your own firm or a third party. Our APIs provide the utmost flexibility for your design and technical teams.
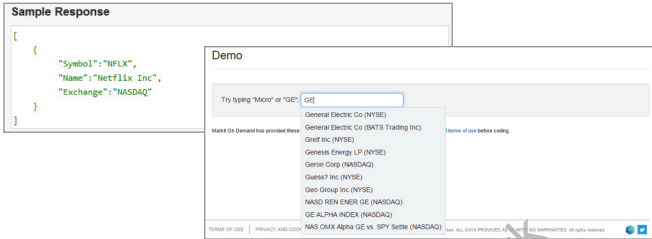

Deliver customized global financial data with APIs

Interactive chart API

Company lookup API

Interactive chart API

Our most feature-rich API

Different indicators available

Configurability options (ex: in color and style)

Chart Builder tools

Renders the historical value of a company's stock
